

Physicians for RELIEF OF ABNORMAL BLEEDING

Until recently, hysterectomy was considered the best treatment for an extremely common women's health problem: heavy menstrual cycles. An exciting development in women's healthcare has changed that. Now women who suffer from excessive periods have options.

Ablation is a form of treatment that is efficient, convenient and much easier on you than a hysterectomy. The procedure is used to remove the lining of the uterus, known as the endometrium. Best of all, Physicians for Women can perform this procedure in different ways, depending on your individual needs. We are pleased to be among the area practices to offer this breakthrough procedure that achieves truly fantastic results:

- ☞ *For about 96% of women, monthly bleeding decreases significantly. (Some women report that their periods stopped completely!)*
- ☞ *It takes only a few minutes and requires minimal anesthesia.*
- ☞ *The only discomfort is mild cramping afterward that is easily managed.*
- ☞ *Most women return to work within one to two days.*

This is certainly not the only solution for heavy, painful cycles. Your doctor will help resolve your problem, no matter which treatment you need. Only you and your doctor can decide what's right for you. Call us any time to schedule a consultation.
